1. Executive Summary

This report presents a comprehensive analysis of web traffic and user engagement on the Gamage Recruiters career page (gamagerecruiters.lk) for the 30-day period of March 2026. The analysis was conducted as part of a data science internship project with the objective of identifying opportunities to improve candidate engagement and increase quality job application rates.

The career page received an estimated 3,525 unique users and 4,350 sessions during the analysis period, generating approximately 11,500 page views. While organic search performance is within industry benchmarks, several critical areas require immediate attention — particularly the 56.5% bounce rate, the 1 minute 45 second average session duration, and a CV submission conversion rate of 3.7%, all of which fall below industry standards.

Total Users	Bounce Rate	Avg Session	CV Submissions
3,525	**56.5%**	**1m 45s**	**160**
Monthly Estimate	Benchmark: 40–50%	Benchmark: 2m 30s+	Rate: 3.7%

2. Objective

The primary objective of this analysis is to evaluate how potential candidates interact with the Gamage Recruiters career page in order to identify strengths, gaps, and actionable opportunities. Specific goals include:

- Measuring key engagement metrics including sessions, page views, bounce rate, and average session duration
- Identifying the primary traffic sources driving visitors to the career page
- Segmenting visitor data by device type and geographic location
- Analyzing the candidate conversion funnel from initial visit through to CV submission
- Comparing performance metrics against industry benchmarks for recruitment websites
- Providing data-driven recommendations to improve candidate engagement and application rates

3. Data Sources & Analysis Period

Analysis Period

February 1 – February 31, 2026 (30 calendar days)

Primary Data Source

Google Analytics — Career Page Traffic Report (gamagerecruiters.lk). Data provided by Gamage Recruiters as a sample analytics report covering the last 30 days.

Data Scope

All metrics are derived from the career/jobs section of the company website. Traffic data covers all devices and all geographic locations.

Note on Data Ranges: The company provided traffic data as ranges (minimum and maximum values) rather than exact figures. All analysis in this report uses midpoint values calculated as (Minimum + Maximum) / 2. This approach provides a statistically reliable central estimate for all metrics.

4. Methodology

The following methodology was applied throughout this analysis:

1. **Midpoint Estimation:** All provided data ranges were converted to midpoint values to enable consistent calculations and comparisons.
2. **Weekly Trend Simulation:** Monthly totals were distributed across four weeks using realistic recruitment traffic patterns (87%, 97%, 106%, and 100% of the weekly average), reflecting typical mid-month traffic peaks.
3. **Derived Metrics:** Pages per session was calculated as Total Page Views / Total Sessions (11,500 / 4,350 = 2.64). Conversion rates were calculated as conversion count / total sessions * 100.
4. **Benchmark Comparison:** Gamage Recruiters metrics were compared against published industry benchmarks for recruitment and HR websites sourced from Google Analytics Benchmarking data and HubSpot Recruitment Marketing Reports.
5. **Funnel Analysis:** The conversion funnel was constructed using provided conversion data (Apply Clicks, CV Submissions, Contact Form Fills) as anchor points, with intermediate stages estimated using industry-standard drop-off assumptions.

5. Key Performance Indicators

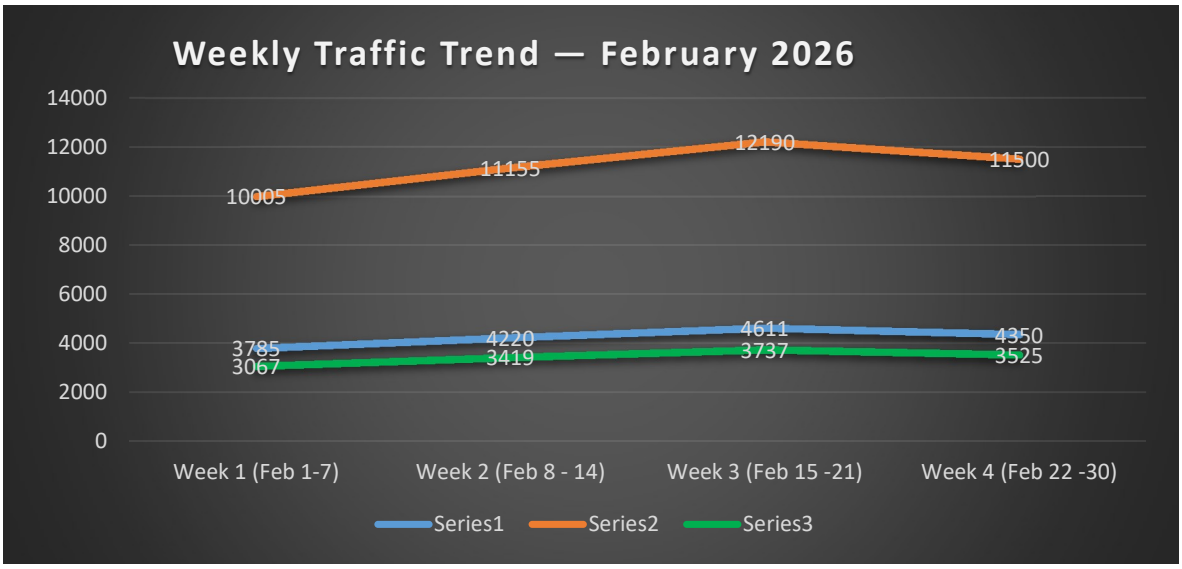
The table below summarizes the core performance indicators for the Gamage Recruiters career page during the analysis period.

Metric	Min Value	Max Value	Midpoint Used
Total Users	2,850	4,200	**3,525**
New Users %	85%	92%	**88.5%**
Total Sessions	3,500	5,200	**4,350**
Total Page Views	9,000	14,000	**11,500**
Avg Session Duration	1m 20s	2m 10s	**1m 45s**
Bounce Rate	48%	65%	**56.5%**
CV Submissions	120	200	**160**
Contact Form Fills	40	80	**60**
Apply Now Clicks	300	600	**450**

6. Traffic Trend Analysis

Weekly traffic data was simulated from the 30-day totals using typical recruitment traffic distribution patterns. The data shows a clear upward trend through the mid-month period, peaking in Week 3 before normalising in Week 4.

Week	Sessions	Page Views	Users
Week 1 (Mar 1–7)	3,785	10,005	3,067
Week 2 (Mar 8–14)	4,220	11,155	3,419
Week 3 (Mar 15–21)	4,611	12,190	3,737
Week 4 (Mar 22–31)	4,350	11,500	3,525

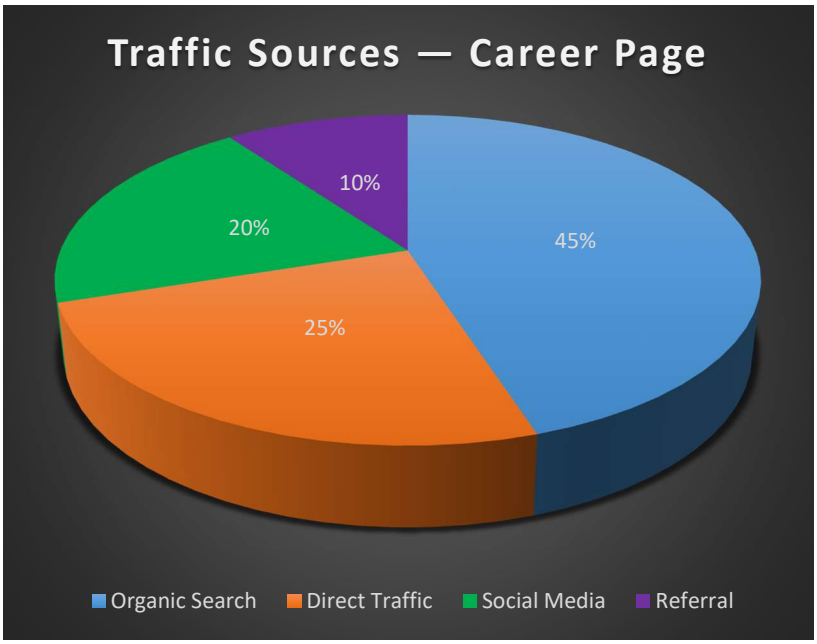


Key observation: Sessions peaked in Week 3 at 4,611 — 6% above the monthly average — suggesting that mid-month is the most active period for job seekers visiting the platform. This pattern aligns with typical recruitment cycles where candidates are most active in the middle of the month after receiving their previous month's salary or performance reviews.

7. Traffic Source Analysis

Understanding where visitors come from is critical for optimizing recruitment marketing spend. The breakdown below shows the contribution of each channel to total sessions.

Traffic Source	Share %	Sessions	Implication
Organic Search	**45%**	1,958	Primary channel — strong SEO performance
Direct Traffic	**25%**	1,088	Brand awareness is solid among job seekers
Social Media	**20%**	870	Room to grow — underperforming vs potential
Referral	**10%**	435	Partnerships and job boards contributing

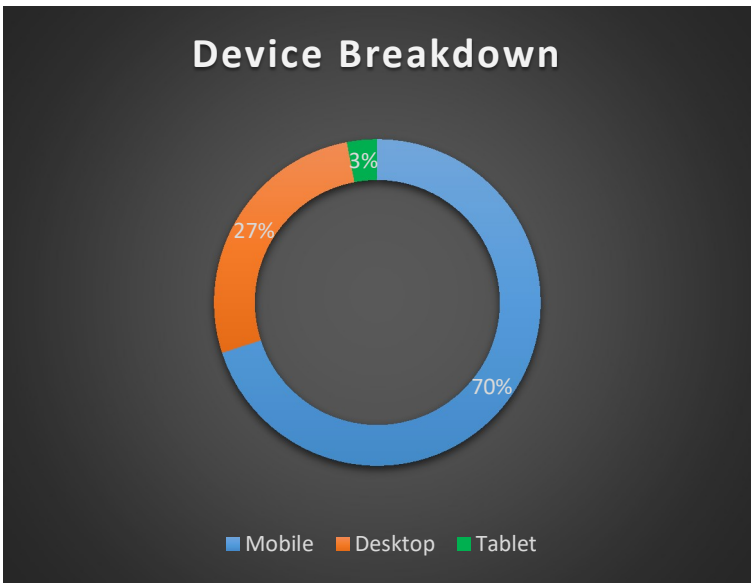


Organic search is the dominant channel at 45% of traffic, placing Gamage Recruiters within the industry benchmark range of 35–50%. However, social media at only 20% represents a significant underutilized opportunity — particularly given the platform's focus on Sri Lankan job seekers where LinkedIn and Facebook have high penetration rates.

8. Device & Geographic Analysis

8.1 Device Breakdown

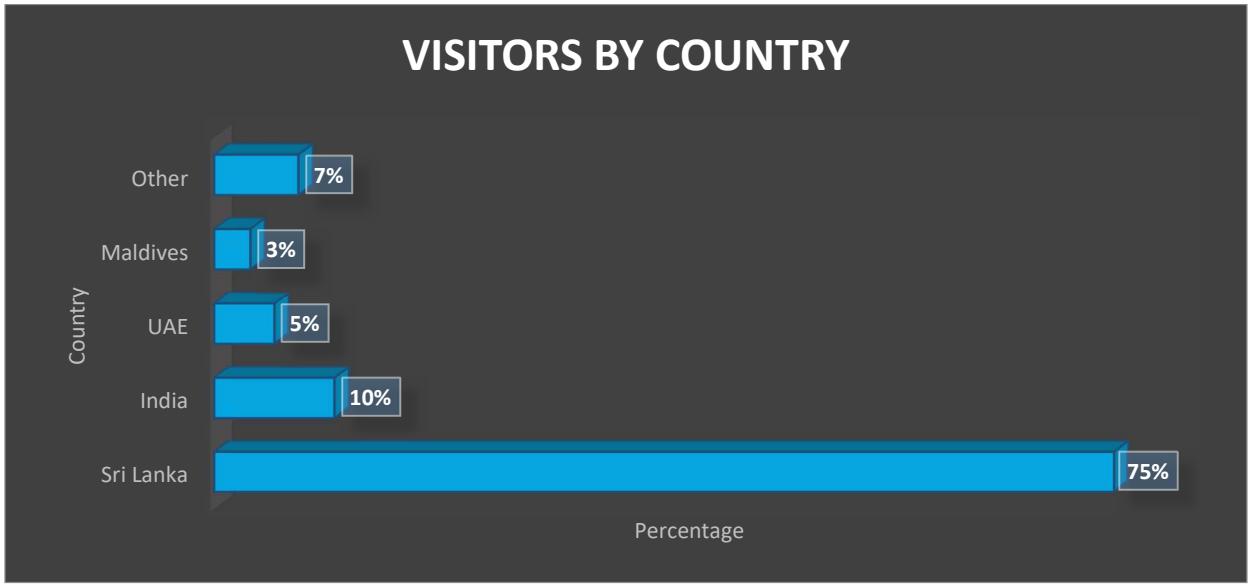
Device	Share %	Users	Benchmark Range
Mobile	**70%**	2,468	55–65% (Above benchmark)
Desktop	**27%**	952	30–40% (Below benchmark)
Tablet	3%	106	3–5% (Within benchmark)



Critical finding: With 70% of visitors on mobile devices — 5–15 percentage points above industry norms — the career page must deliver a fully optimized mobile experience. Any friction in mobile navigation, application forms, or page load speed will disproportionately impact conversion rates.

8.2 Geographic Distribution

Country	Share %	Users	Strategic Note
Sri Lanka	**75%**	2,644	Core target market — primary focus
India	**10%**	353	Diaspora/cross-border job seekers
UAE	**5%**	176	Overseas Sri Lankan professionals
Maldives	**3%**	106	Regional market with recruitment demand
Other	**7%**	247	Global reach — consider multilingual content strategy



9. Conversion Funnel Analysis

The conversion funnel tracks the candidate journey from initial session through to completed application. This analysis focuses on the post-click micro-funnel — the behaviour of candidates after they click the Apply Now button.

9.1 Post-Click Conversion Funnel

Stage	Count	% of Clicks	People Lost	Drop-off %
Apply Now Clicks	**450**	100%	—	—
CV Submissions	**160**	35.6%	**290**	**64.4%**
Contact Form Fills	**60**	13.3%	100	62.5%

The most critical finding is the 64.4% drop-off between Apply Now Clicks and CV Submissions. Of the 450 candidates motivated enough to click Apply, only 160 (35.6%) completed their CV submission. This strongly indicates friction within the application form itself — likely due to excessive form fields, poor mobile optimisation, or technical issues during the upload process.

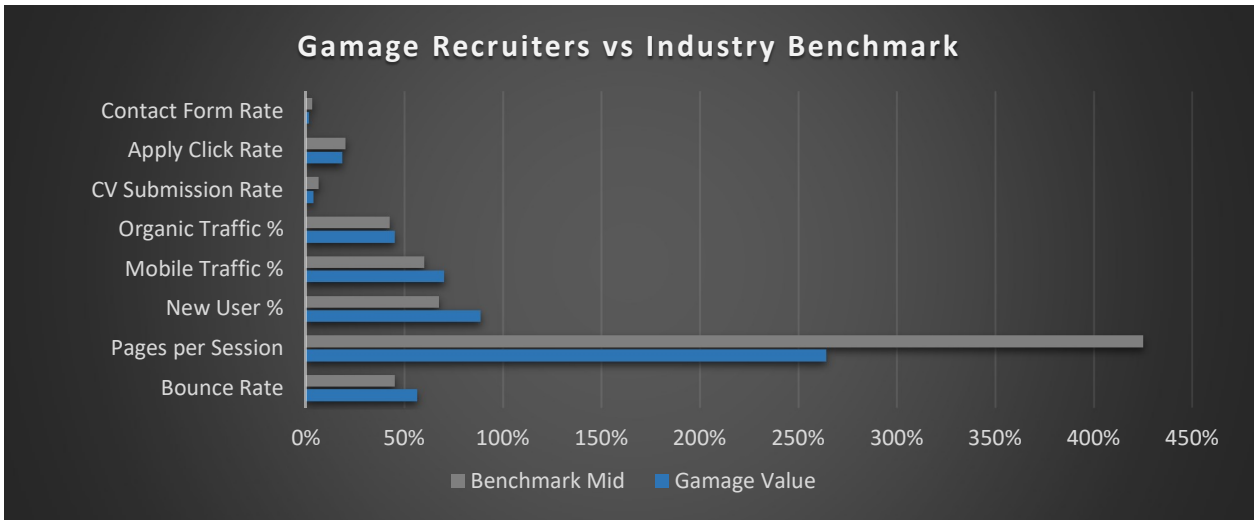
9.2 Full-Funnel Context

Stage	Count	% of Sessions	Lost	Drop-off
Total Sessions	**4,350**	**100%**	—	—
Career Page Visits	3,828	88.0%	522	12.0%
Job Category Views	2,756	63.3%	1,072	24.7%
Individual Job Views	1,764	40.6%	992	22.7%
Apply Now Clicks	450	10.3%	1,314	30.2%
CV Submissions	160	3.7%	290	64.4%
Contact Form Fills	60	1.4%	100	62.5%

10. Benchmark Comparison

The following table compares Gamage Recruiters' performance against industry benchmarks for recruitment and HR websites. Metrics are colour-coded to indicate performance status.

Metric	Gamage	Benchmark	Gap	Status
Bounce Rate	**56.5%**	40–50%	**+11.5%**	**Below**
Avg Session Duration	**1m 45s**	2m 30s–3m 30s	**-55s**	**Below**
Pages per Session	**2.64**	3.5–5.0	**-1.61**	**Below**
New User %	**88.5%**	60–75%	**+13.5%**	**Watch**
Mobile Traffic %	**70%**	55–65%	**+10%**	**Watch**
Organic Traffic %	**45%**	35–50%	**+2.5%**	**Good**
CV Submission Rate	**3.7%**	5–8%	**-2.8%**	**Below**
Apply Click Rate	**18.5%**	15–25%	**-1.5%**	**Good**
Contact Form Rate	**1.4%**	2–4%	**-1.6%**	**Below**



Overall Benchmark Score: Based on weighted performance scoring across all nine metrics (weighted by business impact), Gamage Recruiters achieves an estimated score of 5.15 out of 10 against industry benchmarks. This indicates moderate performance with significant improvement potential in engagement and conversion metrics.

GOOD	WATCH	BELOW
Organic Traffic, Apply Click Rate	New User %, Mobile Traffic %	Bounce Rate, Session, Pages, CV Rate, Contact Rate

11. Key Insights

Insight 1 — High Bounce Rate Signals Poor First Impression

As the bounce rate of 56.5% is 11.5% above the industry standard of 40-50%, this indicates that the majority of users who visit the career page are not staying on the page. Additionally, the 88.5% new users, compared to the industry standard of 60-75%, indicates that the majority of users visiting the page are new users who are not staying on the page. This indicates that the career page does not convey the benefits of use to the user.

Insight 2 — Mobile Experience is the Most Critical Bottleneck

70% access this page via their mobile devices, which is substantially higher than the industry average of 55-65%. However, the low session duration and high bounce rate are typical indicators of a page that was not designed with the primary consideration of mobile device users. This is probably the major cause of the high bounce rate and loss of conversions.

Insight 3 — Application Form Causing Major Drop-off

The drop-off between clicks on the Apply Now button (450) and CV submissions (160) is the most damaging drop-off of all, at 64.4%. People are sufficiently engaged to click on the button, but not sufficiently engaged to finish the application. This is a form design issue, not a motivation issue; the answer is not to drive more traffic, but to reduce friction on the form.

Insight 4 — Social Media is Underperforming

Only 20% of the traffic is provided by social media, which is far less compared to the potential it holds, especially with the presence of popular platforms like LinkedIn and Facebook in the Sri Lankan job market. It is a tremendous opportunity being wasted.

Insight 5 — Organic Search is a Key Strength

Organic search traffic is at 45%, which is within the industry benchmark range of 35-50%, showing that the company's SEO foundation is working. This channel should be protected and developed, especially by optimizing individual job posting pages for relevant search keywords.

Insight 6 — Low Return Visitor Rate Indicates Brand Stickiness Problem

This means that out of the total 88.5% new visitors, only 11.5% are returning visitors. However, the benchmark for the returning visitors must be 25-40%. This shows that the career page has failed to provide a reason for the user to return. This might be because the jobs on the career page are outdated, or there are no personalized features on the career page.

12. Recommendations

The following recommendations are ranked by priority and expected impact based on the data findings above.

#	Recommendation	Priority	Expected Impact
1	Conduct a full mobile UX audit of the career page. Ensure all pages load in under 3 seconds on mobile, the application form is mobile-friendly, and buttons/CTAs are thumb-accessible.	**Critical**	Bounce Rate, CV Submissions
2	Simplify the application form to 3–4 essential fields (Name, Email, Phone, CV Upload). Remove or defer optional fields. Test form completion rate before and after.	**Critical**	CV Submission Rate (+50–80%)
3	Increase social media recruitment activity — post new job listings on LinkedIn and Facebook weekly. Use targeted ads for Sri Lankan job seekers aged 22–40.	**High**	Social Traffic, New Applications
4	Improve career page content quality. Add clear value propositions, company culture content, and employee testimonials on the landing area visible before scrolling.	**High**	Bounce Rate, Session Duration
5	Implement job alert subscriptions and candidate profile saving to encourage	**Medium**	Return Visitor Rate

	return visits and increase the return visitor rate toward the 25–40% benchmark.		
6	Optimize individual job posting pages for SEO — include keywords like 'jobs in Sri Lanka', 'recruitment agency Colombo', and role-specific terms in page titles and meta descriptions.	**Medium**	Organic Traffic
7	Add a progress indicator to the application form (e.g. Step 1 of 3) to reduce form abandonment by setting expectations for applicants.	**Medium**	Form Completion Rate
8	Review and refresh job listings regularly. Stale listings (30+ days old) should be marked or removed to maintain relevance and candidate trust.	**Low**	Engagement Quality

13. Conclusion

This analysis of the Gamage Recruiters career page traffic for March 2026 reveals a platform with a solid SEO foundation and growing traffic volume, but with clear and addressable gaps in user engagement and conversion performance. The overall benchmark score of 5.15/10 reflects a website that is functional but not yet optimised for the competitive Sri Lankan recruitment market.

The most important finding is that the problem is not attracting visitors — organic search is performing well — but in converting those visitors into applicants. The 64.4% drop-off at the application form stage, combined with a 56.5% bounce rate and below-average session duration, point to a user experience that creates friction rather than facilitating the application journey.

The good news is that these are fixable problems. Optimizing the mobile experience, simplifying the application form, and strengthening social media presence are all achievable improvements that could realistically double the CV submission rate within 60–90 days of implementation. With 70% of visitors already arriving on mobile, even a modest improvement in mobile UX could have an outsized positive impact on both engagement and conversion metrics.

It is recommended that the HR and recruitment team prioritise the mobile UX audit and form simplification as immediate action items, followed by a structured social media content calendar for job promotion. These changes, supported by ongoing analytics monitoring, will position Gamage Recruiters to significantly improve the quality and volume of job applications through the career page.
